

WP 3 (INCC, UCL). Analysis of statistical sources.

These statistics will first be the purpose of a descriptive (crossed) analysis. However, a more specific approach will also be adopted in order to gain more in-depth knowledge about the profile of the population concerned. This will thus contribute to deepen an approach in terms of intersectionality. Institutional statistics from the police and courts will be exploited in priority insofar as they help to measure the evolution in the identification of the IPV issue and of public interventions in this area. The data recorded in the courts, at the level of the Prosecutor, will serve as a basis for an in-depth study of the profile of the population concerned, using their socio-demographic data. The statistical analysis will also include a distinct section on spousal homicides. Indeed, one way to objectify as much as possible the quantitative evolution of intimate partner violence is to concentrate its study on extreme cases, i.e. spousal homicides.
